Restaurant Order Analysis Dashboard

Business Intelligence Project Using SQL & Power BI

ADITHYAN AJAYAKUMAR

Project Overview

Converting raw order data into actionable business insights for restaurant management.

SQL

Data extraction & KPI calculations

Power BI

Dashboard & visualization

DAX

Custom measures & KPIs

Business Objectives

- Revenue Performance
- Top-Selling Items
- Customer Behavior
- Peak Operating Hours
- Category Performance
- Actionable Insights

Dashboard KPIs

159.22K

Total Revenue

5,370

Total Orders

29.65

Avg Order Value

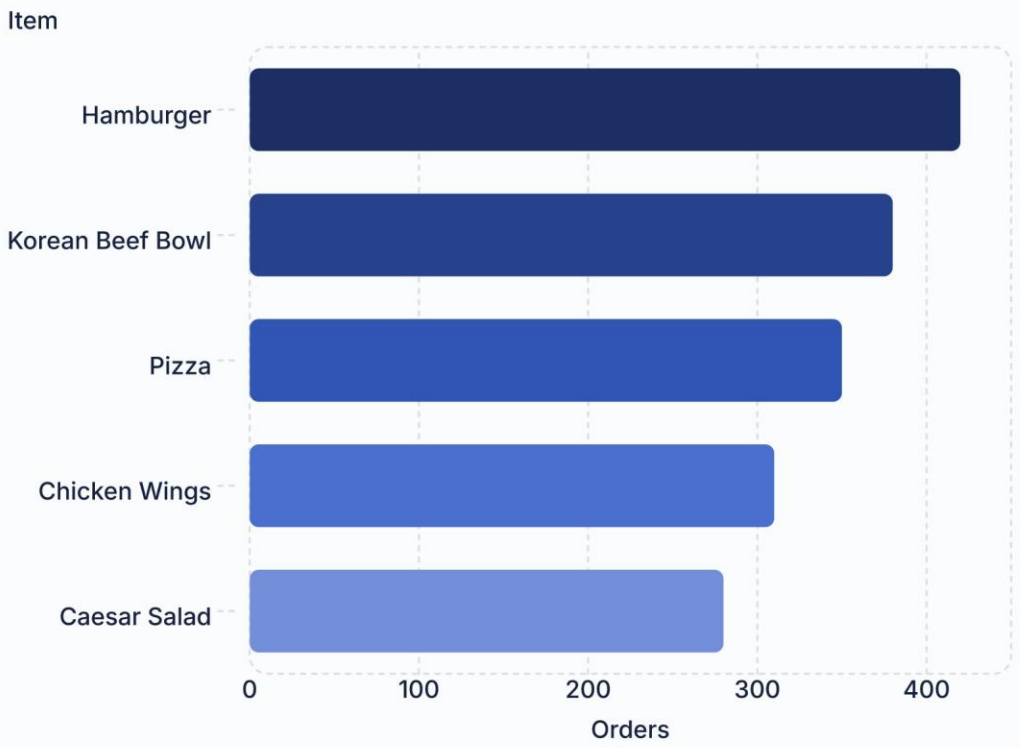
2.28

Items Per Order

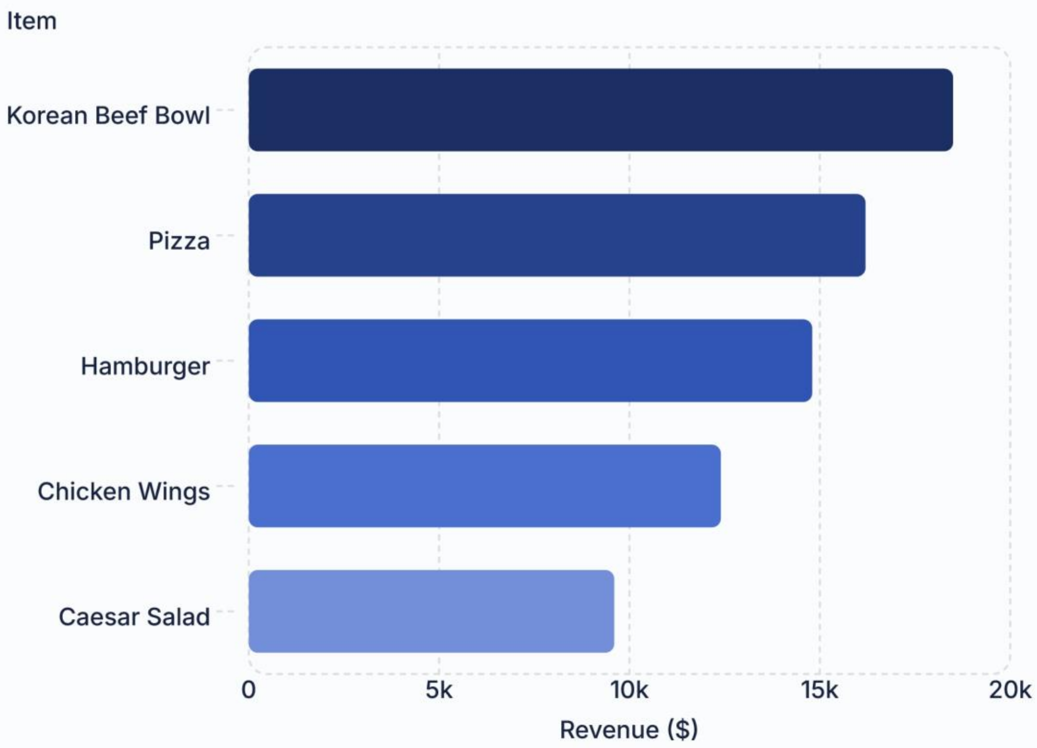
Peak ordering hour: **12:00 PM** — critical for staffing decisions.

Product Performance Analysis

Top-Selling Items

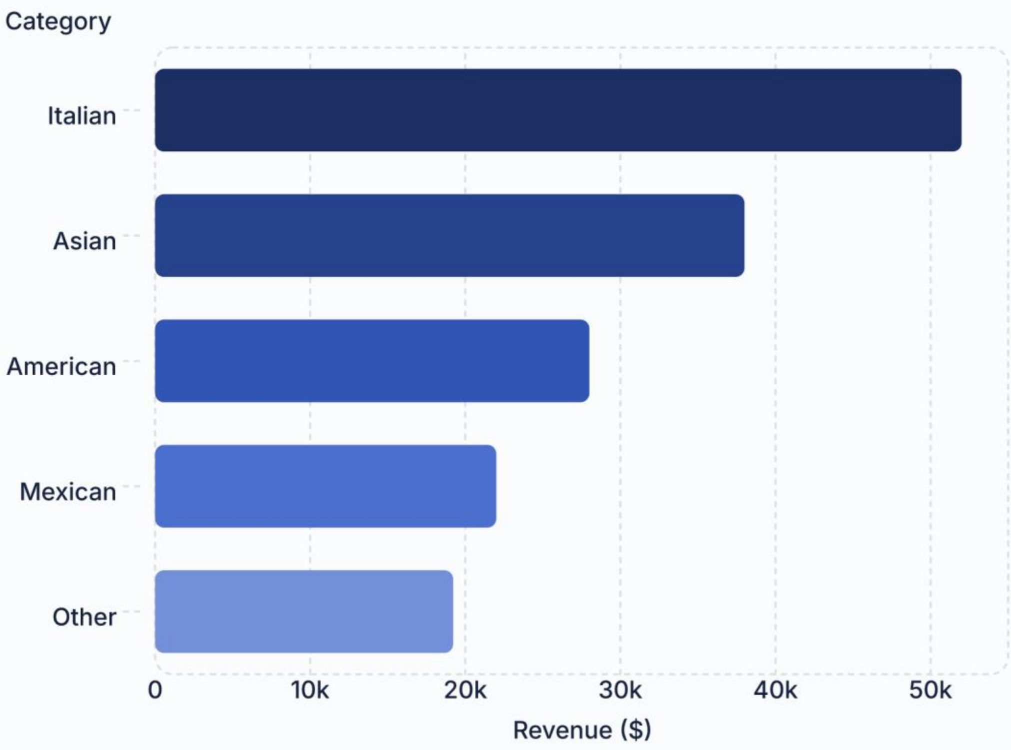


Top Revenue-Generating Items



Hamburger = most ordered · **Korean Beef Bowl** = highest revenue

Category Performance Analysis



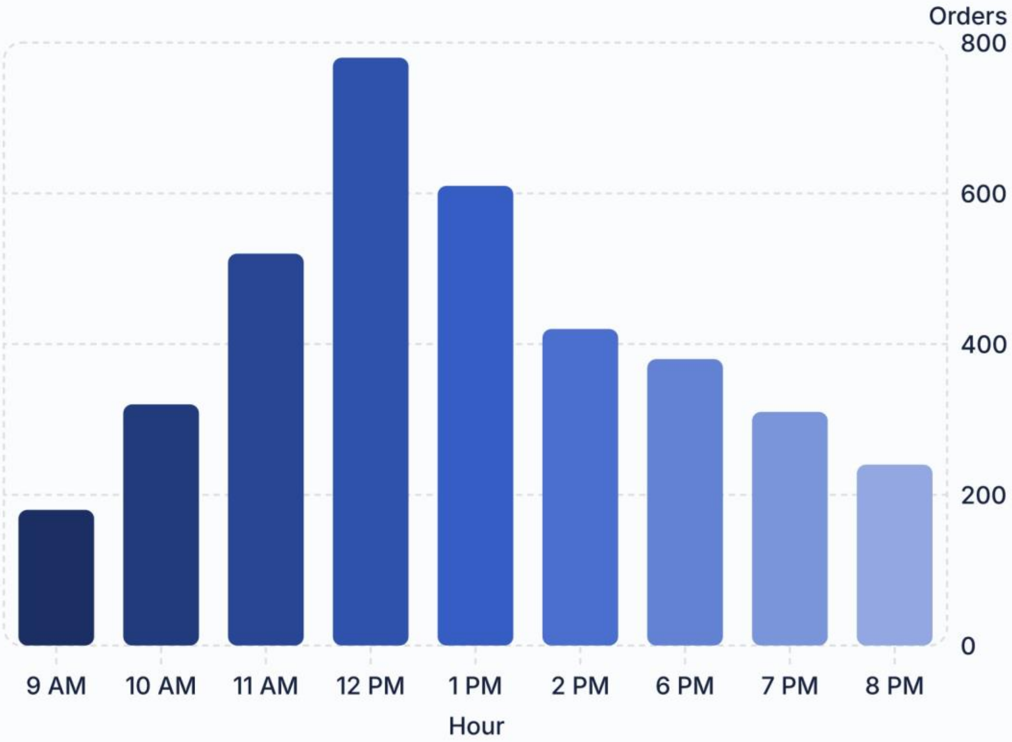
Key Findings

- **Italian** leads all categories in revenue
- **Asian** ranks second
- **American & Mexican** contribute less

Prioritize Italian cuisine in marketing & menu strategy.

Operational & Customer Behavior

Orders by Hour



Key Findings

- Peak demand at **12:00 PM**
- Lunch drives highest traffic
- Avg spend: **$29.65**/order
- Avg items: **2.28**/order

Upselling & combo deals can grow basket size.

Key Business Insights

159.22K Revenue

From 5,370 orders

Hamburger

Top-selling item

Korean Beef Bowl

Highest revenue item

Italian Cuisine

Top category revenue

12:00 PM Peak

Busiest ordering hour

Recommendations & Conclusion

Recommendations

- Staff up for lunch peak
- Promote high-revenue items
- Market Italian cuisine
- Create combo deals
- Monitor low performers

Conclusion

SQL & Power BI transformed raw data into actionable insights.
